

Renderings, Modeling, and Graphics Services

Example Models and Graphics

Roll over the images to activate them

Siebert is now capable of offering High Quality Renderings and Graphics to fit your needs. Technical data, site plans, and schematics are not always understood by non-industry people. That's where a 3D model or rendering becomes important. Renderings can visually express in 3D what a line drawing can't. They can be used for pitch/proposals, marketing, or for community presentations to compliment your 2D drawings or plans.

Renderings are great assets to your projects and can save you money. For example, you design an addition to a building and want to see what it looks like before ever breaking ground. Sunlight, shadows, landscaping, brick/iron work, etc. can all be customized to represent your ideas. These images can also be presented as concept drawings to demonstrate how your design will fit in with the community.

3D models can be presented in several ways:

- **Renderings:** High quality photo-realistic images rendered from a 3D program.
- **Illustrations:** Images that help to make something clear.
- **Photo-Composites:** Images created from combining real world images with computer generated images.
- **Animations / Fly-bys / Walkthroughs:** Video footage of models created in 3D.
